

## **Waste Heat Recovery Potential Locations**

**Date Posted 8/4/2021**

El Paso Natural Gas, L.L.C. (EPNG) is participating in a voluntary program to facilitate the development of natural gas fired turbine compressor station exhaust heat recovery for power generation, as detailed in a INGAA white paper entitled "Waste Heat Recovery Opportunities: Pipelines Present Energy Efficient Proposal. The white paper suggests that pipelines post a listing of gas turbine compressor stations on their system that:

1. Have a total gas turbine station capacity of at least 15,000 hp; and,
2. Operated at or more than 5,200 hours (60% load factor) over the last 12 months.

EPNG currently has six gas turbine compressor stations that meet the criteria stated above located in following county/state: El Paso, Texas (El Paso), Hudspeth, Texas (Cornudas), Culberson, Texas (Guadalupe), Luna, New Mexico (Florida), Coconino, Arizona (Williams) and Hidalgo, New Mexico (Lordsburg).

EPNG is willing to consider proposals from legitimate 3rd party developers for Recovered Energy Generation (REG) waste heat recovery at these compressor stations.
