

## **Explanation of PDA Methods**

### **Swing:**

Swing means that a contract will be designated to take the “swing” (overpulls or underpulls at the location on a daily basis). All other contracts are allocated their scheduled quantity. The contract identified as “swing” is allocated the remaining difference between total quantity to be allocated and quantities allocated to other scheduled contracts. An Operator may elect to have the imbalance allocated to a contract regardless of whether any volumes are scheduled under the contract. If the Swing contract designated does not belong to the Operator, the Shipper whose contract is identified must authorize his contract to be used.

### **Pro Rata:**

The total quantity to be allocated is multiplied by the ratio established by taking each individual scheduled line item and dividing it by the total of all scheduled line items applicable to the quantity to be allocated.

### **Default Agreement**

For all allocation methods, if measured flow from a delivery point is recorded and no scheduling has occurred, the metered volumes will be recorded on a designated default agreement provided by the Operator and agreed to by the Shipper.
